BridgeLog

Privacy and security fact sheet

For principals, district IT and data privacy reviewers · Updated October 2026

> **The short version.** BridgeLog has no servers, no accounts and no database. Student records are created and kept only in the web browser on the device a staff member uses. The developer never receives, stores or can see any student information.

What BridgeLog stores, and where

Everything is kept in the browser's local storage on that one device:

- Students, by initials or first name (the app asks for initials), with their target behaviors, short goal names, the supports staff provide and routine steps.
- Entries staff log: incidents, wins, goal scores and prompt levels, counts and timers, care notes, seizure logs, emergency intervention reports and restorative conversations.
- Settings: auto-lock time, date of the last backup, and the staff member's initials.

BridgeLog doesn't ask for the IEP itself. There are no fields for disability category, diagnosis, services, placement or full goal text, only what a para needs to support the student and take data. Supports stay hidden on screen until staff tap Show.

Nothing is stored anywhere else unless a staff member chooses to save a file.

What can leave the device

Nothing leaves automatically. Files leave only when a staff member saves one:

File	Encrypted?	Purpose
Backup	Yes, when a passcode is set	Restoring the log on the same or another device
Share file for a teammate	Always, with its own passcode	Giving one student's log to a teacher or case manager
Spreadsheet export (CSV)	No	Records, reporting and analysis
Goal data summary and emergency report printouts	No	Meetings and the student's file

Staff should store and send these files the way the district handles other student records, for example on district drives and through district email. The app tells staff to give a share passcode in person, not in the same message as the file.

Network activity

- BridgeLog is a static web page hosted on GitHub Pages. Opening it downloads the app's own code from GitHub. Like any web host, GitHub can see the device's IP address. It never sees student data, which is never sent.
- After the first visit the app runs offline. A service worker keeps a copy of the app's files, and only its files.
- The page carries a Content Security Policy that blocks connections to any other site, outside scripts and form submissions, and external fonts or images. The browser enforces this.
- There are no analytics, ads, cookies, trackers or third-party code. Fonts are served with the app.
- The app currently shares its web address (jakeking-dev.github.io) with the developer's other small public pages. Browsers keep stored data per address, so those pages could technically read unencrypted BridgeLog data on the same device. They contain no code that does. Turning on the passcode keeps the logs encrypted regardless, and a separate address for BridgeLog is planned before school licenses begin.

IT staff can confirm this by opening the browser's developer tools, logging an entry and checking the Network tab.

Encryption and access

- An optional passcode encrypts all student records stored on the device (students, entries and the removal log) using AES-256-GCM, with the key derived from the passcode through PBKDF2-SHA-256 at 210,000 iterations. Encrypted backups use the same protection.
- With a passcode set, the app locks itself after a few minutes without use (staff choose how long). It doesn't lock automatically while a seizure or break timer is running, so those stay on screen.
- A forgotten passcode can't be recovered by anyone, including the developer.
- A few settings stay unencrypted so the app can work before it's unlocked: lock time, last backup date, the staff member's initials, and dates and counts of removals, restores and deletions (no student names).
- Without a passcode, the data is protected only by the device's own sign-in. We recommend school-managed devices, and a passcode on any shared or portable device.

Record integrity

- Entries lock at the end of the day they're entered. After that they can't be edited or deleted.
- A mistake can be voided on the same day, with a required reason. Voided entries are kept and marked.
- Later information is added as dated notes, and the original stays as it was.
- Every entry carries a SHA-256 fingerprint linked to the entry before it. BridgeLog checks the chain each time it opens and names any past record that was changed, deleted or reordered outside the app. Records removed on purpose (archived students) keep their place in the chain with the date and reason.
- Printed goal data summaries and emergency reports carry a code from that chain, so a printout can later be checked against the device's records.
- Record check compares the device against any backup file and lists any record that is missing or was changed after it locked.

Retention and removal

BridgeLog never deletes records on its own, because the district sets how long they are kept. When it's time, "Archive and remove" saves a spreadsheet and a BridgeLog file for one student, asks staff to confirm the archive is where the school keeps records, then removes only that

student from the device. A removal log keeps the date, the number of entries removed and where the archive went.

Student privacy laws

FERPA. Records staff create in BridgeLog are kept by the school, on school devices. No student information is disclosed to BridgeLog or its developer, because none is ever sent.

California. The developer receives no student information: staff enter records on their own device and they stay there. That means there is nothing for it to sell, use for advertising or build profiles from, which are the concerns addressed by the Student Online Personal Information Protection Act (SOPIPA) and Education Code 49073.1.

If your district requires a data privacy agreement, such as the California Student Data Privacy Agreement, contact us and we'll complete it. This sheet describes how the software works and isn't legal advice. Your district should make its own determination.

Review the code

The full source is public at github.com/JakeKing-Dev/bridgelog, so your IT staff can read exactly what the app does.

Contact

Jacob King, maker of BridgeLog · jacobnotjoking@gmail.com

BridgeLog's seizure and emergency features are record-keeping tools. Staff follow each student's seizure action plan, behavior plan and district procedures. The emergency intervention report helps staff record what happened; it doesn't replace the district's own behavioral emergency report form.
